Description:

This project is a microservices-based scalable notification system that supports multi-channel delivery (Email and SMS) using Kafka, Spring Boot, Redis, and MySQL. The repository includes complete source code, presentation slides, system architecture, and demonstration videos organized in respective folders.

How to Run:

- 1 Clone the GitHub repository
- 2 Run `./start-services.sh` to start all services
- 3 Use POST `/api/send-notification` API to send notifications
